

EDUCATION · LANGUAGE

Lingo

The only app here with depth — every touchable thing sits on a 4px lip and presses down onto it. Colour is a state machine, not decoration.

SCOPE

6 screens, built and shot on device

STACK

SwiftUI · Swift 6 · async/await · iOS 26

STANDARD

Light + dark · Dynamic Type · VoiceOver

Swift

SwiftUI

Canvas

SpriteKit

SwiftData

Self-initiated demo build. Designed and coded end to end by me to show current iOS 26 / SwiftUI standards — not client work, and no client material appears in it.

Screens in this build

● The problem

Learning apps are graded on streaks, not on teaching. The tell is the wrong-answer screen: "Not quite!" and a red X teaches nothing, and the distractors are usually random words rather than the forms a learner actually confuses.

● What I built

The only app in the portfolio with real depth — every touchable surface sits on a 4px darker lip and presses down onto it, so what is tappable is obvious without a single hint. Colour is a state machine: leaf is correct, clay is wrong, stone is locked, amber is the streak. Nothing is coloured for looks.

02 Engineering decisions

- ✓ The mistake screen names the actual rule — cada verano makes it a habit, so Spanish takes the imperfect — and shows the minimal pair
- ✓ Distractors are plausible, not random: comía (imperfect), como (present), comeré (future) around the correct comí
- ✓ Lesson path positions and its dotted spine are computed from one list, so a new unit cannot desync them
- ✓ Word-build tiles leave their slots behind in the bank rather than reflowing it on every tap
- ✓ No tab bar; the path is the navigation and a HUD carries hearts, streak and crown progress
- ✓ Nunito 700–900 only — there is no light weight anywhere in the app

AVSpeechSynthesizer

Semantic colour state machine

● What this transfers to your build

A learning loop with real depth: progression state, spaced review, mistake handling and reward moments that motivate without the streak-shaming. The template for education, training, onboarding or any app that has to teach something.

03 Every screen, shipped

6 screens, built in SwiftUI and captured on device. Light and dark, Dynamic Type and VoiceOver labels are wired on each one.

Multiple choice

Word build

A wrong answer, explained

Unit complete

League standings

04 What a build like this gets you

- ✓ Production SwiftUI screens, not clickable prototypes — code your team can ship
- ✓ MVVM + Clean Architecture with a design token layer: colors, type, spacing, radii
- ✓ async/await networking, actors and structured concurrency. No third-party UI deps
- ✓ Light and dark, Dynamic Type, VoiceOver labels and reduced-motion paths from day one

05 How we can work together

Screen build

3 screens

6 days

3 SwiftUI screens from your designs, with the token layer and mock data.

MOST PICKED

Feature or MVP

6+ screens

12 days

6+ screens, MVVM, navigation stack, async/await API layer, light and dark.

Full app or rescue

End to end

3 weeks+

End to end build, or an audit and rescue of an inherited codebase, to App Store.

06 Also on the table

- UIKit / Objective-C → SwiftUI migration, Swift 6 strict concurrency
- On-device AI with Apple Foundation Models, Core ML, Vision
- Claude and OpenAI integrations with streaming, cost control and privacy
- StoreKit 2 subscriptions, Widgets, Live Activities, App Intents and Siri
- Crash, performance and App Store rejection fixes on an existing app
- XCTest, Fastlane, Xcode Cloud and GitHub Actions CI/CD

07 How the build runs

DAY 0

Requirements

You send designs or a reference app, target iOS version and API docs. The clock starts here, not the day we agree to work together.

DAY 2

Foundation

Design tokens, navigation shell and data models land. You get a build you can run on your own device.

DAY 6

Screens

Feature screens built against real or mock data, pushed to your repo daily. No silent weeks.

HANDOFF

Ship

Code walkthrough on Loom, one revision round, and a checklist for App Store submission.

Send me the app you are trying to build

Message me with what you are working on — the screens, the deadline, and where it is stuck. I will tell you straight whether I am the right fit, what it takes and how long it runs. Reply the same day, most days.
