

AI · PRODUCTIVITY

NativeAIStudio

Message turns instead of chat bubbles, streaming with a soft caret. No purple gradient, no bouncing dots.

SCOPE

6 screens, built and shot on device

STACK

SwiftUI · Swift 6 · async/await · iOS 26

STANDARD

Light + dark · Dynamic Type · VoiceOver

- Swift
- SwiftUI
- async/await
- AsyncSequence streaming
- SwiftData

Self-initiated demo build. Designed and coded end to end by me to show current iOS 26 / SwiftUI standards — not client work, and no client material appears in it.

Screens in this build

● The problem

Every AI client currently looks the same: a purple gradient, a sparkle on every button, a chat bubble around the assistant's text, and three bouncing dots standing in for work being done.

● What I built

Warm ink, no tab bar, and message turns instead of cards — the user's turn is compact and right-inset, the assistant's is full width with no container at all, and that asymmetry is the whole design. Glass appears on three things across six screens.

02 Engineering decisions

- ✓ Streaming response with a soft caret — no typewriter jitter, no bouncing dots
- ✓ Tool-run chips with icon, name, argument and duration; running is a progress underline
- ✓ Source citations as a superscript numeral with a row beneath
- ✓ Composer that grows to five lines, with the send fill earned by being non-empty
- ✓ Prose is IBM Plex Sans; every machine-generated fact is IBM Plex Mono

Citrine #DFC069 on warm ink

● What this transfers to your build

A production pattern for putting an LLM inside an iOS app: AsyncSequence token streaming, cancellation, cost control, on-device history in SwiftData and keys held in Keychain. This is what an AI feature in your existing app actually looks like.

03 Every screen, shipped

6 screens, built in SwiftUI and captured on device. Light and dark, Dynamic Type and VoiceOver labels are wired on each one.

First run

Model and privacy

04 What a build like this gets you

- ✓ Production SwiftUI screens, not clickable prototypes — code your team can ship
- ✓ MVVM + Clean Architecture with a design token layer: colors, type, spacing, radii
- ✓ async/await networking, actors and structured concurrency. No third-party UI deps
- ✓ Light and dark, Dynamic Type, VoiceOver labels and reduced-motion paths from day one

05 How we can work together

Screen build

3 screens

6 days

3 SwiftUI screens from your designs, with the token layer and mock data.

MOST PICKED

Feature or MVP

6+ screens

12 days

6+ screens, MVVM, navigation stack, async/await API layer, light and dark.

Full app or rescue

End to end

3 weeks+

End to end build, or an audit and rescue of an inherited codebase, to App Store.

06 Also on the table

- UIKit / Objective-C → SwiftUI migration, Swift 6 strict concurrency
- On-device AI with Apple Foundation Models, Core ML, Vision
- Claude and OpenAI integrations with streaming, cost control and privacy
- StoreKit 2 subscriptions, Widgets, Live Activities, App Intents and Siri
- Crash, performance and App Store rejection fixes on an existing app
- XCTest, Fastlane, Xcode Cloud and GitHub Actions CI/CD

07 How the build runs

DAY 0

Requirements

You send designs or a reference app, target iOS version and API docs. The clock starts here, not the day we agree to work together.

DAY 2

Foundation

Design tokens, navigation shell and data models land. You get a build you can run on your own device.

DAY 6

Screens

Feature screens built against real or mock data, pushed to your repo daily. No silent weeks.

HANDOFF

Ship

Code walkthrough on Loom, one revision round, and a checklist for App Store submission.

Send me the app you are trying to build

Message me with what you are working on — the screens, the deadline, and where it is stuck. I will tell you straight whether I am the right fit, what it takes and how long it runs. Reply the same day, most days.
