

SLEEP · WIND-DOWN

Nocturne

Six screens with no card, no tab bar and no saturated colour anywhere. Read in a dark bedroom, so nothing on it is pure white.

SCOPE

6 screens, built and shot on device

STACK

SwiftUI · Swift 6 · async/await · iOS 26

STANDARD

Light + dark · Dynamic Type · VoiceOver

- Swift
- SwiftUI
- Canvas / TimelineView
- HealthKit
- AVAudioEngine

Self-initiated demo build. Designed and coded end to end by me to show current iOS 26 / SwiftUI standards — not client work, and no client material appears in it.

Screens in this build

• The problem

Sleep apps are read at 3am in a dark bedroom and then designed at noon on a calibrated display. The result is a #FFF headline that works like a flashlight, a stock photograph of a bed, and a cartoon moon.

• What I built

The only gradient ground in the portfolio — the screen darkens toward the home indicator the way a room does — with no containers at all, no chrome at all, and no chromatic accent. Peak ink is 88%, never 100%, because contrast is a comfort decision here, not a compliance one.

02 Engineering decisions

- ✓ Zero containers: no card, plate, sheet or row background on any of the six screens
- ✓ Zero chrome: no tab bar, no nav bar, no back control — navigation is a word or a dot
- ✓ The orb is three stacked radial gradients, not a bordered circle — a 1px ring would be a container
- ✓ Hypnogram drawn from a real night's shape: deep sleep front-loaded, REM lengthening toward morning, three brief wakes — not a sine wave
- ✓ 4-7-8 breathing with Weil's actual counts; the alarm is a window arc because waking mid-N3 is what makes an alarm brutal
- ✓ Newsreader Light, no uppercase anywhere, tracking never above zero

Swift

SwiftUI

Canvas / TimelineView

HealthKit

AVAudioEngine

No accent colour by design

• What this transfers to your build

Audio, timers and background sessions done properly — playback that survives lock, a wind-down flow that respects reduced motion, and a dark palette engineered for a bedroom at 3am. Applies to any audio, meditation, sleep or long-session app.

03 Every screen, shipped

6 screens, built in SwiftUI and captured on device. Light and dark, Dynamic Type and VoiceOver labels are wired on each one.

04 What a build like this gets you

- ✓ Production SwiftUI screens, not clickable prototypes — code your team can ship
- ✓ MVVM + Clean Architecture with a design token layer: colors, type, spacing, radii
- ✓ async/await networking, actors and structured concurrency. No third-party UI deps
- ✓ Light and dark, Dynamic Type, VoiceOver labels and reduced-motion paths from day one

05 How we can work together

Screen build

3 screens

6 days

3 SwiftUI screens from your designs, with the token layer and mock data.

MOST PICKED

Feature or MVP

6+ screens

12 days

6+ screens, MVVM, navigation stack, async/await API layer, light and dark.

Full app or rescue

End to end

3 weeks+

End to end build, or an audit and rescue of an inherited codebase, to App Store.

06 Also on the table

- UIKit / Objective-C → SwiftUI migration, Swift 6 strict concurrency
- On-device AI with Apple Foundation Models, Core ML, Vision
- Claude and OpenAI integrations with streaming, cost control and privacy
- StoreKit 2 subscriptions, Widgets, Live Activities, App Intents and Siri
- Crash, performance and App Store rejection fixes on an existing app
- XCTest, Fastlane, Xcode Cloud and GitHub Actions CI/CD

07 How the build runs

DAY 0

Requirements

You send designs or a reference app, target iOS version and API docs. The clock starts here, not the day we agree to work together.

DAY 2

Foundation

Design tokens, navigation shell and data models land. You get a build you can run on your own device.

DAY 6

Screens

Feature screens built against real or mock data, pushed to your repo daily. No silent weeks.

HANDOFF

Ship

Code walkthrough on Loom, one revision round, and a checklist for App Store submission.

Send me the app you are trying to build

Message me with what you are working on — the screens, the deadline, and where it is stuck. I will tell you straight whether I am the right fit, what it takes and how long it runs. Reply the same day, most days.
