

COMMERCE · EDITORIAL RETAIL

ShopEase

Photography sits on warm paper with no container at all. The whole app has exactly one glass element.

SCOPE

6 screens, built and shot on device

STACK

SwiftUI · Swift 6 · async/await · iOS 26

STANDARD

Light + dark · Dynamic Type · VoiceOver

Swift

SwiftUI

async/await

Nuke-free image pipeline

StoreKit 2

Self-initiated demo build. Designed and coded end to end by me to show current iOS 26 / SwiftUI standards — not client work, and no client material appears in it.

Screens in this build

● The problem

Marketplace apps all converge on the same look: a dense grid, a red sale badge, a card around everything. That template makes every product look like every other product.

● What I built

A curated-objects shop set on warm paper, in an editorial register — photography sits directly on the ground with no container, prices are ink, and the accent is reserved for a markdown. The chrome is a text-only dock; the whole app has exactly one glass element.

02 Engineering decisions

- ✓ Eighteen CC0 object plates, licence asserted per item at download
- ✓ Studio backdrops knocked out and recomposited onto the app's own paper
- ✓ Size run with sold-out struck through, glaze swatch row, sticky glass buy bar
- ✓ Fraunces display over a system sans, with.19em uppercase labels
- ✓ Light-locked: the warm sand ground is the identity, so there is no dark set

Core Data

Oxblood #8A3418 on warm sand

● What this transfers to your build

An editorial commerce front end that keeps the product photography intact: image-forward cells, a bag with real empty and error states, and a checkout that does not lose the customer. Reusable for any retail, marketplace or D2C app where the catalogue is the brand.

03 Every screen, shipped

6 screens, built in SwiftUI and captured on device. Light and dark, Dynamic Type and VoiceOver labels are wired on each one.

04 What a build like this gets you

- ✓ Production SwiftUI screens, not clickable prototypes — code your team can ship
- ✓ MVVM + Clean Architecture with a design token layer: colors, type, spacing, radii
- ✓ async/await networking, actors and structured concurrency. No third-party UI deps
- ✓ Light and dark, Dynamic Type, VoiceOver labels and reduced-motion paths from day one

05 How we can work together

Screen build

3 screens

6 days

3 SwiftUI screens from your designs, with the token layer and mock data.

MOST PICKED

Feature or MVP

6+ screens

12 days

6+ screens, MVVM, navigation stack, async/await API layer, light and dark.

Full app or rescue

End to end

3 weeks+

End to end build, or an audit and rescue of an inherited codebase, to App Store.

06 Also on the table

- UIKit / Objective-C → SwiftUI migration, Swift 6 strict concurrency
- On-device AI with Apple Foundation Models, Core ML, Vision
- Claude and OpenAI integrations with streaming, cost control and privacy
- StoreKit 2 subscriptions, Widgets, Live Activities, App Intents and Siri
- Crash, performance and App Store rejection fixes on an existing app
- XCTest, Fastlane, Xcode Cloud and GitHub Actions CI/CD

07 How the build runs

DAY 0

Requirements

You send designs or a reference app, target iOS version and API docs. The clock starts here, not the day we agree to work together.

DAY 2

Foundation

Design tokens, navigation shell and data models land. You get a build you can run on your own device.

DAY 6

Screens

Feature screens built against real or mock data, pushed to your repo daily. No silent weeks.

HANDOFF

Ship

Code walkthrough on Loom, one revision round, and a checklist for App Store submission.

Send me the app you are trying to build

Message me with what you are working on — the screens, the deadline, and where it is stuck. I will tell you straight whether I am the right fit, what it takes and how long it runs. Reply the same day, most days.
