

SOCIAL · CREATOR

SocialFlow

Pure mono on black, edge-to-edge media, no radius on content — the only colour is the photography.

SCOPE

6 screens, built and shot on device

STACK

SwiftUI · Swift 6 · async/await · iOS 26

STANDARD

Light + dark · Dynamic Type · VoiceOver

Swift

SwiftUI

async/await

AVFoundation

Nuke

Self-initiated demo build. Designed and coded end to end by me to show current iOS 26 / SwiftUI standards — not client work, and no client material appears in it.

Screens in this build

● The problem

A social feed is judged on the photography, and most designs bury it: a card, a border, a radius and a shadow around every post, and the picture ends up as an illustration inside a UI.

● What I built

Pure mono, black ground, and no containers and no radius anywhere on content. Media runs edge to edge, grids run at 1pt gutters, and the only colour on the screen is the photography.

02 Engineering decisions

- ✓ Forty-two CC0 frames, licence asserted per item, on one shared grade
- ✓ Story rail: 2.5pt gradient ring unseen, hairline seen
- ✓ Chrome that dissolves on scroll, with a compose pill instead of a plus-in-a-circle
- ✓ 1pt-gutter mosaic with a 2x2 anchor tile
- ✓ Inter Tight set tight and large — and nothing is ever uppercased

Core Data

Hot pink #FF2E63 on black

● What this transfers to your build

A media feed that stays smooth at scale — prefetching, cell reuse, edge-to-edge video and image handling, plus compose and profile flows. The base for any social, community, creator or in-app feed feature.

03 Every screen, shipped

6 screens, built in SwiftUI and captured on device. Light and dark, Dynamic Type and VoiceOver labels are wired on each one.

04 What a build like this gets you

- ✓ Production SwiftUI screens, not clickable prototypes — code your team can ship
- ✓ MVVM + Clean Architecture with a design token layer: colors, type, spacing, radii
- ✓ async/await networking, actors and structured concurrency. No third-party UI deps
- ✓ Light and dark, Dynamic Type, VoiceOver labels and reduced-motion paths from day one

05 How we can work together

Screen build

3 screens

6 days

3 SwiftUI screens from your designs, with the token layer and mock data.

MOST PICKED

Feature or MVP

6+ screens

12 days

6+ screens, MVVM, navigation stack, async/await API layer, light and dark.

Full app or rescue

End to end

3 weeks+

End to end build, or an audit and rescue of an inherited codebase, to App Store.

06 Also on the table

- UIKit / Objective-C → SwiftUI migration, Swift 6 strict concurrency
- On-device AI with Apple Foundation Models, Core ML, Vision
- Claude and OpenAI integrations with streaming, cost control and privacy
- StoreKit 2 subscriptions, Widgets, Live Activities, App Intents and Siri
- Crash, performance and App Store rejection fixes on an existing app
- XCTest, Fastlane, Xcode Cloud and GitHub Actions CI/CD

07 How the build runs

DAY 0

Requirements

You send designs or a reference app, target iOS version and API docs. The clock starts here, not the day we agree to work together.

DAY 2

Foundation

Design tokens, navigation shell and data models land. You get a build you can run on your own device.

DAY 6

Screens

Feature screens built against real or mock data, pushed to your repo daily. No silent weeks.

HANDOFF

Ship

Code walkthrough on Loom, one revision round, and a checklist for App Store submission.

Send me the app you are trying to build

Message me with what you are working on — the screens, the deadline, and where it is stuck. I will tell you straight whether I am the right fit, what it takes and how long it runs. Reply the same day, most days.
