

TRANSIT · NAVIGATION

Wayfare

The map is the ground and a three-detent sheet is the only container. It has no brand colour at all — the palette is the network's own.

SCOPE

6 screens, built and shot on device

STACK

SwiftUI · Swift 6 · async/await · iOS 26

STANDARD

Light + dark · Dynamic Type · VoiceOver

Swift

SwiftUI

MapKit

presentationDetents

CoreLocation

Self-initiated demo build. Designed and coded end to end by me to show current iOS 26 / SwiftUI standards — not client work, and no client material appears in it.

Screens in this build

● The problem

Transit apps recolour the network to match their own brand, which throws away the one piece of information every rider already knows by heart — that the U8 is dark blue. Then they bury disruptions in a banner at the top, disconnected from the leg they actually affect.

● What I built

Wayfare has no accent colour of its own. The palette is the network's real one, and the only non-line colour in the app is a red used for nothing but disruption. The map is the ground on every screen with a geography, and a bottom sheet at three detents trades map for timetable.

02 Engineering decisions

- ✓ Three detents — peek 208pt, half 452pt, full 748pt — and the sheet is the app's only container
- ✓ Street map generated as vector, with an irregular block grid; a perfectly regular grid reads as a placeholder instantly
- ✓ Barlow in two widths, split semantically: Semi Condensed means "this is a place on the network", normal Barlow is prose and times
- ✓ Countdowns are tabular so the column never shifts as it ticks; rows without real-time data say so instead of guessing
- ✓ Disruption appears inline at the leg it affects — the out-of-service lift is on the interchange, not in a banner
- ✓ Real Berlin lines, real official colours, real interchanges, real headways

CoreLocation

GTFS-Realtime

No brand accent by design

● What this transfers to your build

Map-first UI with a three-detent sheet, live departures and disruption states — the hard parts of any location app. Reusable for transit, delivery, field ops, travel or store-locator features.

03 Every screen, shipped

6 screens, built in SwiftUI and captured on device. Light and dark, Dynamic Type and VoiceOver labels are wired on each one.

Nearby, sheet at peek

Route options, sheet at half

The journey, sheet at full

Departure board

Planned closure

Saved places and lines

04 What a build like this gets you

- ✓ Production SwiftUI screens, not clickable prototypes — code your team can ship
- ✓ MVVM + Clean Architecture with a design token layer: colors, type, spacing, radii
- ✓ async/await networking, actors and structured concurrency. No third-party UI deps
- ✓ Light and dark, Dynamic Type, VoiceOver labels and reduced-motion paths from day one

05 How we can work together

Screen build

3 screens

6 days

3 SwiftUI screens from your designs, with the token layer and mock data.

MOST PICKED

Feature or MVP

6+ screens

12 days

6+ screens, MVVM, navigation stack, async/await API layer, light and dark.

Full app or rescue

End to end

3 weeks+

End to end build, or an audit and rescue of an inherited codebase, to App Store.

06 Also on the table

- UIKit / Objective-C → SwiftUI migration, Swift 6 strict concurrency
- On-device AI with Apple Foundation Models, Core ML, Vision
- Claude and OpenAI integrations with streaming, cost control and privacy
- StoreKit 2 subscriptions, Widgets, Live Activities, App Intents and Siri
- Crash, performance and App Store rejection fixes on an existing app
- XCTest, Fastlane, Xcode Cloud and GitHub Actions CI/CD

07 How the build runs

DAY 0

Requirements

You send designs or a reference app, target iOS version and API docs. The clock starts here, not the day we agree to work together.

DAY 2

Foundation

Design tokens, navigation shell and data models land. You get a build you can run on your own device.

DAY 6

Screens

Feature screens built against real or mock data, pushed to your repo daily. No silent weeks.

HANDOFF

Ship

Code walkthrough on Loom, one revision round, and a checklist for App Store submission.

Send me the app you are trying to build

Message me with what you are working on — the screens, the deadline, and where it is stuck. I will tell you straight whether I am the right fit, what it takes and how long it runs. Reply the same day, most days.
