

INVESTING · FINTECH

WealthKit

Server-driven UI — the backend describes the flow, so new screens ship without an App Store release.

SCOPE

6 screens, built and shot on device

STACK

SwiftUI · Swift 6 · async/await · iOS 26

STANDARD

Light + dark · Dynamic Type · VoiceOver

- Swift
- SwiftUI
- Swift Charts
- Combine
- Core Data

Self-initiated demo build. Designed and coded end to end by me to show current iOS 26 / SwiftUI standards — not client work, and no client material appears in it.

Screens in this build

● The problem

Most investing apps hardcode their screen states, so every layout change needs an App Store release. WealthKit is built server-driven: the backend describes the flow, the client renders it.

● What I built

A net-worth hero, an allocation ring and a tabular ledger that all read at a glance — and a light grey ground with inset grouped cards, the most native surface Apple ships.

02 Engineering decisions

- ✓ Server-driven UI — new flows ship without a release
- ✓ Allocation donut and 40×16pt sparklines drawn in Swift Charts
- ✓ Amount keypad with count-up animation and a masked privacy state
- ✓ Keychain + Face ID, with a real Reduce Transparency fallback
- ✓ Light and dark sets, both signed off

● What this transfers to your build

Money screens are unforgiving: precise numbers, live states and no room for a rounding error. Server-driven layout, SwiftUI Charts, Keychain and biometrics here are the same pieces a banking, investing, lending or wallet app needs — built by someone who has shipped them inside regulated financial firms for 11 years.

03 Every screen, shipped

6 screens, built in SwiftUI and captured on device. Light and dark, Dynamic Type and VoiceOver labels are wired on each one.

04 What a build like this gets you

- ✓ Production SwiftUI screens, not clickable prototypes — code your team can ship
- ✓ MVVM + Clean Architecture with a design token layer: colors, type, spacing, radii
- ✓ async/await networking, actors and structured concurrency. No third-party UI deps
- ✓ Light and dark, Dynamic Type, VoiceOver labels and reduced-motion paths from day one

05 How we can work together

Screen build

3 screens

6 days

3 SwiftUI screens from your designs, with the token layer and mock data.

MOST PICKED

Feature or MVP

6+ screens

12 days

6+ screens, MVVM, navigation stack, async/await API layer, light and dark.

Full app or rescue

End to end

3 weeks+

End to end build, or an audit and rescue of an inherited codebase, to App Store.

06 Also on the table

- UIKit / Objective-C → SwiftUI migration, Swift 6 strict concurrency
- On-device AI with Apple Foundation Models, Core ML, Vision
- Claude and OpenAI integrations with streaming, cost control and privacy
- StoreKit 2 subscriptions, Widgets, Live Activities, App Intents and Siri
- Crash, performance and App Store rejection fixes on an existing app
- XCTest, Fastlane, Xcode Cloud and GitHub Actions CI/CD

07 How the build runs

DAY 0

Requirements

You send designs or a reference app, target iOS version and API docs. The clock starts here, not the day we agree to work together.

DAY 2

Foundation

Design tokens, navigation shell and data models land. You get a build you can run on your own device.

DAY 6

Screens

Feature screens built against real or mock data, pushed to your repo daily. No silent weeks.

HANDOFF

Ship

Code walkthrough on Loom, one revision round, and a checklist for App Store submission.

Send me the app you are trying to build

Message me with what you are working on — the screens, the deadline, and where it is stuck. I will tell you straight whether I am the right fit, what it takes and how long it runs. Reply the same day, most days.
